

Assignment-4

CSE201 Advanced Programming

Name : Harsh Gupta
Roll no : 2023229

Starting Application

To start the application run the file name Assignment.java
The package name should be the same as the folder name AP_assignment_4
Use IntelliJ to run the program.

GUI Enhancements

Select the third functionality on the home screen of the application and a GUI interface will be displayed which is the menu, listing all the currently available items, I have assumed that 4 items are already available and rest can be added by the admin. At the bottom of screen user can switch to see the pending order list which will be updated after the checkout process of the customer and the orders will be left admin to complete.

I have used AWT/Swing to implement the GUI with JPanel, JFrame, JTable, etc.

I/O Stream Management

I have used functions like `FileWriter` and `BufferedReader` to read and write data during the execution of the program. The updated data may not be visible in the runtime but it is updated in the runtime and when the program ends the file will have correct data in it.

Save order histories for (every) user: This data is stored in two different files one for the vip users and other for the non-vip user since i have not implemented the login system which is optional so i have created history for only these types of users.

Temporary Cart Storage: The order is added to the cart is updated in real time and is stored in the `cart.txt` file.

JUnit Testing

Ordering out-of-stock items: I have maintained a function in the functionality class for customers that will return true or false according to the item availability by taking the item name as input and this method is tested in the Testing file by taking different item which are both available or not available.

Cart Operations: Similarly another method is present in the functionality class for customer that will calculate the cart total for both vip and non vip customer That is also tested in all three scenarios in the testing file .

Assumption :

Assuming these items are already added to the cart

```
public void add_basic_thing() {  
  
    item_name.add("coffee");  
}
```

```
    item_prize.add("40");

    item_category.add("vegetarian");

    item_availability.add("yes");

    item_name.add("tea");

    item_prize.add("20");

    item_category.add("vegetarian");

    item_availability.add("yes");

    item_name.add("pizza");

    item_prize.add("150");

    item_category.add("vegetarian");

    item_availability.add("yes");

    item_name.add("chicken burger");

    item_prize.add("100");

    item_category.add("non-vegetarian");

    item_availability.add("yes");
}
```
